Abstracts

Avalanche photodiode chips are highly sensitive photodetectors that are often used to detect weak light signals. When working in a reverse bias state, when light shines on it, the photogenerated electron-hole pairs generated will collide and ionize under the action of a strong electric field, forming an avalanche effect, which greatly amplifies the original photocurrent. APD chips use the avalanche effect to amplify the photogenerated current, thereby significantly improving the photoelectric conversion efficiency and sensitivity. This device has a wide range of applications in optical communications, LiDAR, quantum communications and other fields.

The global Avalanche Photodiode Chips market size was estimated at USD 146.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
