### Report Overview:

An avalanche transceiver is a battery-powered device that sends and receives radio signals. It is used to locate people who have been buried in an avalanche. Avalanche transceivers are typically worn by skiers, snowboarders, and other backcountry users who are at risk of being caught in an avalanche.

Avalanche transceivers work by sending out a radio signal that can be picked up by other avalanche transceivers. If someone is buried in an avalanche, their avalanche transceiver will continue to send out a signal until the battery dies. The other avalanche transceivers in the group can then be used to locate the buried person.

The Global Avalanche Transceiver Market Size was estimated at USD 244.50 million in 2023 and is projected to reach USD 322.07 million by 2029, exhibiting a CAGR of 4.70% during the forecast period.
