Abstracts

Aviation combustion engines, also known as aircraft piston engines, are internal combustion engines specifically designed to power propeller-driven aircraft, including small general aviation airplanes, helicopters, unmanned aerial vehicles (UAVs), and some light sport aircraft. These engines operate on the principle of converting chemical energy from aviation fuel—typically aviation gasoline (avgas) or, in some newer models, jet fuel or diesel—into mechanical energy to drive a propeller or rotor system. They are characterized by their reliability, relatively simple mechanical design compared to turbine engines, and suitability for lower-speed, shorter-range flight operations. Key variants include horizontally opposed (boxer) engines, radial engines, and inline configurations, with modern examples often featuring electronic ignition and fuel injection systems to improve efficiency and emissions performance. While largely supplanted by turboprop and jet engines in commercial and military aviation, combustion engines remain dominant in the training, recreational, and utility aircraft segments due to their lower acquisition and operating costs.

The global Aviation Combustion Engine market size was estimated at USD 28000.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -2.50% during the forecast period.
