Abstracts

Aviation Ground Power Units (GPUs) are essential equipment used at airports to supply electrical power to aircraft while they are on the ground. They provide the necessary power for various systems within the aircraft when the engines are not running, such as air conditioning, lighting, avionics, and other onboard equipment. This ensures that the aircraft can remain operational during ground operations without needing to keep the engines running, which helps save fuel and reduces engine wear. The global increase in air travel, driven by economic growth, particularly in emerging markets, is expanding the number of aircraft in operation. This requires more ground support infrastructure, including GPUs, to manage aircraft during ground operations. The expansion of commercial and military fleets, including the introduction of new aircraft models, increases demand for advanced GPUs capable of supporting different power requirements. Advances in technology have led to more efficient GPUs that provide the required power at lower energy consumption, which is increasingly important for airport operations looking to reduce energy costs. Newer GPU designs are more compact, portable, and easier to maneuver, making them more versatile for use at airports with limited space or for mobile applications at remote parking areas. Some modern GPUs come with digital controls and smart features such as remote monitoring, diagnostics, and automatic voltage regulation, enhancing operational efficiency and reliability. GPUs help reduce the need for aircraft auxiliary power units (APUs), which burn fuel when the aircraft is on the ground. By using GPUs instead, airlines can save on fuel costs and reduce carbon emissions, aligning with global sustainability goals. Increasing demand for electric GPUs as airports seek to replace traditional diesel-powered units with cleaner, more sustainable alternatives to reduce their carbon footprint. Many airports are implementing green infrastructure and zero-emission strategies, and using electric or hybrid GPUs fits into this broader trend of reducing the environmental impact of airport operations.

The global Aviation Ground Power Units market size was estimated at USD 560.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
