Report Overview

Predictive maintenance in aviation refers to the use of advanced data analytics, artificial intelligence (AI), machine learning (ML), and Internet of Things (IoT) technologies to anticipate potential equipment or component failures before they occur. It involves collecting real-time data from aircraft sensors, flight systems, and maintenance logs, and then using predictive models to identify abnormal patterns or early signs of wear and tear. By predicting failures before they happen, airlines, MRO (Maintenance, Repair, and Overhaul) providers, and OEMs can schedule maintenance efficiently, reduce unplanned downtime, extend equipment lifespan, and enhance flight safety. This approach represents a shift from traditional reactive or scheduled maintenance to a more intelligent, data-driven strategy, significantly improving operational efficiency and reducing maintenance costs.

In 2024 alone, global MRO (Maintenance, Repair and Overhaul) spend reached \$114 billion ? a 7.2% increase over pre-pandemic highs in 2019 ? and the climb isn?t slowing. maintenance and health monitoring ? powered by data science, digital twins, and real-time engine data ? is becoming a smarter, faster, and more scalable way to manage aviation?s most urgent operational challenges, with the potential to cut maintenance costs by up to 40%.

By harnessing data, predictive maintenance enhances both security and efficiency, identifying issues before they become critical to ensure safer flights while optimising maintenance workflows.

The global Aviation Predictive Maintenance market size was estimated at USD XX

million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of XX% during the forecast period.
