Abstracts

Aviation radar systems are electronic systems used in the aviation industry to detect, track, and provide information about aircraft, obstacles, and other relevant objects in the airspace. These systems operate by emitting radio waves and then analyzing the reflected signals. The main components of an aviation radar system include a transmitter that generates the radio waves, an antenna that broadcasts and receives the signals, and a receiver that processes the reflected waves. By measuring the time it takes for the radio waves to travel to an object and back, as well as the frequency and amplitude of the reflected signals, the radar system can determine the distance, speed, and direction of the detected objects.

The global Aviation Radar Systems market size was estimated at USD 5620.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
