Abstracts

Bone density or bone mineral density (BMD) is the amount of bone mineral in bone tissue. Bone density measurement is used in clinical medicine as an indirect indicator of osteoporosis and fracture risk. Bone densitometers are known to offer improved diagnostic sensitivity in cases of osteoporotic fractures, playing a vital role in diagnosis of fracture before it could occur. It is measured by a procedure called densitometry, often performed in the radiology or nuclear medicine departments of hospitals or clinics. The measurement is painless and non-invasive and involves low radiation exposure. A significant driver in the axial bone densitometry market is the increasing awareness of osteoporosis and the importance of early diagnosis. Axial bone densitometry, such as dual-energy X-ray absorptiometry (DXA) scans, plays a crucial role in assessing bone health and fracture risk, especially in aging populations. However, a notable challenge in this market is the need for broader accessibility to bone densitometry services, particularly in underserved regions. Ensuring that individuals have convenient access to these diagnostic tools and addressing disparities in healthcare access are essential challenges to overcome, as early detection and management of osteoporosis can significantly reduce the burden of this debilitating condition.

The global Axial Bone Densitometry market size was estimated at USD 182.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
