Report Overview

An axial-flow ducted air-breathing engine is a jet engine that emits a jet of hot exhaust gases formed from air that is forced into the engine by several stages of centrifugal, axial or ram compression, which is then heated and expanded through a nozzle. They are typically gas turbine engines. The majority of the mass flow through a ducted jet engine is provided by air taken from outside of the engine and heated internally, using energy stored in the form of fuel.
