## Abstracts

An axial-flow ducted air-breathing engine is a jet engine that emits a jet of hot exhaust gases formed from air that is forced into the engine by several stages of centrifugal, axial or ram compression, which is then heated and expanded through a nozzle. They are typically gas turbine engines. The majority of the mass flow through a ducted jet engine is provided by air taken from outside of the engine and heated internally, using energy stored in the form of fuel.

The global Axial Flow Ducted Air Breathing Engines market size was estimated at USD 44980.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
