## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Axial Needle Bearings competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global average unit price of axial needle bearings is about US\$5.1, and the annual output is estimated to be more than 200 million pieces. Axial needle bearings are high-rigidity, thin-section rolling bearings designed to withstand axial loads. They are usually composed of needle roller cage assemblies and washers. They have a compact structure and low friction coefficient and can effectively support high axial loads in a limited space. The needle rollers run between washers in a radial arrangement. Compared with ball thrust bearings, they have stronger load capacity and smaller thickness. They are important components in transmission systems with high speed, high load and limited space. They are widely used in automotive transmissions, agricultural machinery, gearboxes, power tools, engineering hydraulic equipment and office equipment, and are particularly suitable for working conditions that require separate layout and high axial positioning accuracy. In recent years, with the rapid development of new energy vehicles, electric transmission systems and compact industrial equipment, the demand for high-performance and long-life axial needle bearings has continued to rise, driving their steady growth in the Asia-Pacific (especially China), North America and Eastern Europe markets.

The global Axial Needle Bearings market size was estimated at USD 1109.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
