## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Azimuth Stern Propulsion System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global annual sales of the azimuth stern propulsion system were expected to reach approximately 7,700 units, with an average selling price of US\$71,000 per unit. This highly maneuverable marine propulsion system integrates propulsion and steering functions and is commonly used in tugboats, offshore support vessels, cruise ships, and special-purpose vessels. The system consists of a 360-degree rotatable propulsion unit mounted at the stern of the vessel. The unit includes a propeller, an electric motor or diesel power source, a reduction gearbox, and an adjustable control system. Rotating the propeller allows for complex maneuvers such as lateral, oblique, and pivoting. Unlike traditional straight-shaft and rudder systems, the azimuth stern propulsion system eliminates the need for rudders. Shifting the propeller allows for flexible change of thrust direction, significantly improving vessel maneuverability, positioning accuracy, and energy efficiency. It is a crucial component of modern port operations and dynamic positioning (DP) systems.

The global Azimuth Stern Propulsion System market size was estimated at USD 550.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
