Report Overview:

Azo polymerization initiator is a compound having azo group (R-N=N-R'), which decomposes with heat and/or light, and forms carbon radical. The formed carbon radical is excellent in reactivity, and progresses polymerization and halogenation reactions of different types of vinyl monomers.

Azonitrile decomposition rates show minor solvent effects and are not affected by transition metals, acids, bases and many other components of the environment. These result in two advantages of Azo Polymerization Initiator; their decomposition rates are predictable and they can be used for curing resins that contain a variety of extraneous materials. A drawback of azonitriles over peroxides, however, is the formation of toxic tetrasubstituted succinonitrile derivatives due to recombination of the alkyl radicals.

The Global Azo Polymerization Initiator Market Size was estimated at USD 369.93 million in 2023 and is projected to reach USD 468.08 million by 2029, exhibiting a CAGR of 4.00% during the forecast period.
