Abstracts

The main function of the back grinding tape for touch panels is to be pasted on the back of the glass or glass composite substrate during grinding to effectively protect it from cracking, scratching and contamination. The tape is usually made of PET or other high-strength substrates, and the surface is covered with a special adhesive that is highly heat-resistant and chemically resistant. It has excellent adhesion stability and peeling cleanliness, and can adapt to the complex physical conditions in wet or dry grinding environments. During the grinding process, since the glass material is fragile and the thickness precision requirements are extremely high, the back tape must not only ensure that it is firmly adhered, but also be easy to peel off after processing to avoid residual glue affecting the next process or the quality of the finished product.

Market TrendsWith the continuous upgrading of consumer electronic products, the demand for touch panels has grown rapidly, especially in the fields of smartphones, tablets, car displays and wearable devices, which has driven the market expansion of back grinding tape as a key auxiliary material. The trend of high resolution and thinness has promoted the continuous improvement of touch panel manufacturing precision, making the requirements for the performance of protective materials more stringent, and prompting grinding tapes to develop in the direction of high adhesion, no residual glue, and high cleanliness. At the same time, the rise of new display technologies such as OLED, Mini/Micro-LED has also brought more stringent grinding precision control requirements, which has accelerated the innovation of tape materials.

Market DisadvantagesThe industry entry threshold is relatively high. High-end products have strict requirements on adhesive technology, material formulation and process control, resulting in large technical barriers, making it difficult for domestic small and medium-sized enterprises to enter the high-end market. Japanese and Korean companies have a strong voice in the field of high-end tape materials, resulting in some core technologies relying on imports and being controlled by others. The touch panel manufacturing process has extremely

high requirements for the consistency and stability of the tape. Once problems such as weak bonding, residual glue or difficulty in peeling occur, it will directly affect the yield rate and increase manufacturing costs. **Market Outlook** With the expansion of multiple application scenarios such as smart terminals, automotive electronics, industrial control and medical displays, the market prospects for back grinding tapes for touch panels are optimistic. In the future, display technology will pursue thin, light, high-transparency and high-strength material structures, which will put higher requirements on the accuracy and stability of the back grinding process, thereby increasing the market value of high-performance grinding tapes. It is expected that in the next few years, functional composite and environmentally friendly tapes will become the mainstream trend. For example, products with multifunctional integration such as high temperature resistance, moisture resistance, corrosion resistance and easy peeling will be more favored by terminal manufacturers.

The global Back Grinding Tape for Touch Panel market size was estimated at USD 203.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
