Report Overview

BGT (Backside Grinding Tape) is used to protect the wafer surface during back grinding after the IC is formed on the wafer. Attached on the circuit surface, it prevents damages to the circuit surface and pollutions to the wafer surface and improves the grinding accuracy of the wafer. Especially, it can perfectly protect the wafer pattern surface and the chip during the manufacturing process with its excellent physical and chemical properties. With developments of jumbo-sized and thinned wafer and high-bumped wafer, the function required to the BG tape are (1) low contamination levels, (2) highly close contact to wafer-, and (3) easiness of peeling. Dicing Tape is a type of adhesive tape used in semiconductor manufacturing, also known as cutting tape. It is usually made of polyimide film, with high strength and high temperature resistance. In semiconductor manufacturing, chips need to be separated by cutting them into small pieces. Dicing Tape fixes the chip on the back cutting machine and protects the chip surface from damage during the cutting process. The selection of Dicing Tape depends on the size and shape of the chip, as well as the cutting disc and cutting parameters used during the cutting process. Usually, manufacturers provide different types and specifications of Dicing Tapes to meet different application requirements.
