Report Overview

Compared to conventional CMOS image sensors with a front-illuminated structure, it has achieved roughly double the sensitivity while also reducing noise. Emitting light from the back side of the silicon substrate has made it possible to increase the amount of light entering each pixel without being obstructed by metal wiring or transistors, allowing it to reduce the degradation of sensitivity caused by different optical angles. It can capture smooth, high resolution images even in settings with dark environments such as night views.

The global Back-illuminated CMOS Image Sensor market size was estimated at USD 10000 million in 2023 and is projected to reach USD 16894.79 million by 2032, exhibiting a CAGR of 6.00% during the forecast period.
