Abstracts

Backscatter X-ray machines are specialized security screening devices that utilize low-energy X-rays to create high-resolution images of objects and individuals by detecting the radiation that scatters back from the target, rather than transmitting through it; these systems are primarily employed for non-invasive inspection in aviation security, law enforcement, customs, and critical infrastructure protection due to their ability to detect organic materials, plastics, explosives, and narcotics with greater sensitivity compared to traditional transmission X-ray systems, while also offering reduced radiation exposure and the capability to produce detailed surface images that highlight concealed threats on persons or within luggage.

The global Backscatter X Ray Machines market size was estimated at USD 720.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
