Abstracts

Enteric diseases are infections that affect the gastrointestinal tract, which includes the stomach, small intestine, and large intestine. These diseases can be caused by various microorganisms such as bacteria, viruses, or parasites. Some common examples of enteric diseases include *Clostridium difficile* (*C. difficile*), campylobacteriosis, cholera, *Escherichia coli* (*E. coli*), *Helicobacter pylori* (*H. pylori*), salmonellosis, shigellosis, norovirus, rotavirus, amebiasis, cryptosporidiosis, and giardiasis. Various laboratory tests are used to diagnose enteric diseases and identify the specific pathogen causing an enteric disease. These tests typically involve analyzing samples of stool, blood, or other bodily fluids for the presence of enteric pathogens, such as bacteria, viruses, and parasites. The surge in incidence rate of shigellosis, *Clostridium difficile* (*C. difficile*), campylobacteriosis, cholera, *Escherichia coli* (*E. coli*), salmonellosis, and cholera, which may further cause severe diarrhea or death, drive the growth of the enteric disease testing market size. For instance, according to research article "The burden of diarrhea, etiologies, and risk factors in India from 1990 to 2019: evidence from the global burden of disease study" published in 2022, in India, the total number of deaths of all ages was 632,344 in 2019 and the mortality rate is 45 per 100,000 population.

The global Bacterial Enteric Disease Testing market size was estimated at USD 3239.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
