Abstracts

Bagasse pellet machines are specialized industrial equipment designed to compress and mold bagasse—the fibrous residue left after sugarcane or sorghum stalks are crushed to extract their juice—into dense, uniform pellets through a process of high-pressure extrusion and heating. These machines are engineered to handle the unique properties of bagasse, including its fibrous structure, moisture content, and low bulk density, transforming it into a stable, energy-dense solid biofuel suitable for combustion in boilers, furnaces, or as a raw material in further industrial processes. The operational principle typically involves grinding the raw bagasse to a consistent particle size, conditioning it with steam or moisture to achieve optimal binding, and forcing it through a die with rotating rollers to form pellets, which are then cooled and screened to ensure quality and durability.

The global Bagasse Pellet Machine market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
