Report Overview

Balanced optical receiver is a device for receiving optical signals. It usually has two photodetectors for receiving the photocurrent on the reference beam and the signal beam. This device reduces common-mode noise and improves signal quality. In some cases, balanced light receivers can also have three low-frequency monitoring outputs that are used to help align light to the photodiode, perform low-frequency diagnostics, and make it simple to manually balance the power between the signal light and the reference light.
