### Report Overview

A ball valve with a handwheel is a valve used to control the flow of fluids. It consists of a spherical valve body and a manually operated handwheel. There is a through hole inside the valve ball, which can be opened or closed when the fluid passes through. When the handwheel rotates, the ball connected to the valve stem will turn, and when the through hole is aligned with the pipe, the fluid can flow; when the handwheel continues to rotate and the ball turns to the closed position, the fluid flow is blocked. The handwheel design makes manual operation convenient. It is usually made of corrosion-resistant materials and is suitable for various working conditions. It is widely used in industries such as petroleum, natural gas, water treatment, and chemicals, and is suitable for occasions that require quick opening and closing.

The global Ball Valve with Hand Wheel market size was estimated at USD 1582 million in 2023 and is projected to reach USD 2010.67 million by 2032, exhibiting a CAGR of 2.70% during the forecast period.
