Abstracts

Balloon biliary catheters are specialized medical devices designed for use in interventional radiology and gastroenterology procedures, primarily to treat obstructions within the biliary tract by means of balloon dilation. These catheters feature an inflatable balloon near the distal tip, which is advanced into narrowed or blocked bile ducts—often due to conditions like strictures, stones, or tumors—and then inflated to restore patency and facilitate drainage or stent placement. Constructed from biocompatible materials such as polyurethane or silicone, they are engineered for flexibility, radiopacity, and controlled inflation/deflation, with variations in balloon diameter, length, and catheter shaft design to accommodate different anatomical requirements and clinical scenarios, including both diagnostic and therapeutic applications in hepatobiliary medicine.

The global Balloon Biliary Catheters market size was estimated at USD 450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
