Abstracts

Balloon dilation catheters are minimally invasive medical devices used to treat narrowed or obstructed blood vessels, heart valves, or other tubular structures within the body; they consist of a flexible catheter with an inflatable balloon at its tip, which, when positioned at the site of constriction, is expanded to compress plaque or stretch tissue, thereby restoring normal lumen diameter and improving blood flow or function. These devices are critical in procedures such as angioplasty, valvuloplasty, and the treatment of strictures in various organs, with designs often tailored to specific anatomical and clinical requirements, including balloon size, material compliance, and integration with other therapeutic or diagnostic features.
