Abstracts

Bamboo activated carbon is a carbonaceous adsorption material with developed pore structure, large specific surface area and strong selective adsorption prepared by activation process with bamboo (charcoal) as the basic raw material. It is widely used in the refining and purification process of military industry, food, metallurgy, chemical industry, environmental protection, hospital and other industries. Bamboo activated carbon is the fourth type of activated carbon after coal activated carbon, wood activated carbon and coconut shell activated carbon. In recent years, with the strengthening of environmental protection, the improvement of food safety standards and the rise of new energy batteries, the demand for activated carbon has increased, and it has become an indispensable and important product in life and industrial and agricultural production. Bamboo activated carbon is divided into powder and granular. The size less than 80 mesh (0.18 mm) is powdered bamboo activated carbon, and the subdivision specifications are expressed in mesh or mm according to its particle size. The size greater than 80 mesh is granular bamboo activated carbon, and the subdivision specifications are expressed in mesh or mm according to its particle size.

The global Bamboo Activated Carbon market size was estimated at USD 138.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
