Abstracts

The Bare Die Silicon Carbide (SiC) Schottky Diode is a semiconductor device fabricated from silicon carbide material and delivered in an unpackaged, chip-level form, intended for integration into custom modules or hybrid circuits. Unlike traditional silicon diodes, SiC Schottky diodes leverage the superior material properties of silicon carbide—including higher thermal conductivity, greater breakdown voltage, and higher operating temperatures—to deliver enhanced performance in power electronics applications. These diodes exhibit near-zero reverse recovery losses, reduced switching losses, and improved efficiency, making them particularly suitable for high-frequency, high-temperature, and high-power density environments such as electric vehicle (EV) power systems, renewable energy inverters, industrial motor drives, and telecommunications infrastructure. As a bare die, they provide design flexibility, reduced parasitic inductance, and improved thermal management in multi-chip modules, though they require specialized assembly and packaging expertise.

The global Bare Die Sic Schottky Diode market size was estimated at USD 28.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
