## Abstracts

Barium strontium titanate (BST) is a ferroelectric ceramic material with a perovskite crystal structure, characterized by its composition-dependent Curie temperature and exceptional dielectric properties, including high tunability, low dielectric loss, and strong nonlinear behavior in response to electric fields, making it particularly suitable for applications in tunable microwave devices such as phase shifters, varactors, and frequency-agile filters, as well as in dynamic random-access memory (DRAM) capacitors, infrared sensors, and energy storage systems due to its adjustable stoichiometry ( $\text{Ba}_{1-x}\text{Sr}_x\text{TiO}_3$ ), which allows precise control over its electrical characteristics to meet specific operational requirements across varying temperature ranges and frequencies.

The global Barium Strontium Titanate market size was estimated at USD 105.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
