Report Overview

The basal metabolic rate meter is a specially designed instrument for measuring the energy consumed by the human body at rest to evaluate the individual's basal metabolic rate. This measurement method is usually used to evaluate the individual's basal metabolic rate, that is, the amount of energy that the human body needs to consume in a resting state. Common basal metabolic rate measurement instruments include respiratory metabolic meters and metabolic meters. These instruments can calculate the energy metabolic rate of the human body by measuring the inhaled and exhaled oxygen and carbon dioxide content, heart rate and other indicators, and then evaluate the subject's basal metabolic rate. The level of basal metabolic rate is related to factors such as human health status, nutritional status, age, and gender. Therefore, by measuring the basal metabolic rate, doctors can better understand the physical condition and energy needs of the subject and formulate corresponding diet and exercise plans.
