Abstracts

Basalt fiber composite is a high-performance material manufactured by combining continuous filaments of basalt rock—a volcanic igneous rock formed from the rapid cooling of lava—with a polymer matrix, typically epoxy, polyester, or vinyl ester resin, to create a reinforced composite that offers superior mechanical properties, including high tensile strength, excellent corrosion resistance, thermal stability, and sound insulation. It is produced through a melt-extrusion process where crushed basalt rock is heated to around 1,500°C, formed into continuous fibers, and then woven or aligned into various forms such as fabrics, rovings, or chopped strands before being impregnated with resin to form the final composite product, which is used across industries like construction, automotive, aerospace, and marine for applications requiring durability, lightweight characteristics, and resistance to harsh environments.

The global Basalt Fiber Composite market size was estimated at USD 120.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
