The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Basalt Fiber Precursor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Basalt Fiber Precursor will reach 80,000 tons, with an average selling price of US\$2,142.8 per ton. The gross profit margin is about 10%-15%, and the single-line production capacity is 2,000 tons. Basalt fiber is a new type of inorganic, environmentally friendly, green, high-performance fiber material. It is made by rapidly drawing basalt stone, composed of oxides such as silica and alumina, through a high-temperature melt through a sieve. Continuous basalt fiber not only has high strength but also exhibits numerous excellent properties, including electrical insulation, corrosion resistance, and high-temperature resistance. The basalt fiber production process generates minimal waste and poses minimal environmental pollution. Once discarded, the product degrades directly in the environment without causing any harm, making it a green, environmentally friendly material. Basalt fiber precursor is a continuous fiber precursor made by melting basalt stone at high temperatures and then drawing it through a wire drawing process. It represents the primary form of basalt fiber production and possesses excellent properties, including high strength, high-temperature resistance, and chemical resistance.

The global Basalt Fiber Precursor market size was estimated at USD 171.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
