Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Base Metal Conductor Paste competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Base metal conductor paste is a thick film conductor paste with base metals such as copper (Cu), nickel (Ni), aluminum (Al) and their alloys as the conductive phase. Compared with precious metal conductor paste (such as Ag, Au, Pt, etc.), base metal conductor paste has advantages such as low cost and abundant resources, but technical challenges such as oxidation resistance and conductive stability need to be solved. Cu metal has many excellent properties. Cu has better high-frequency characteristics and conductivity than the precious metal Au. At the same time, Cu does not have migration defects like Ag, and Cu has a higher melting point than Ag, which can make the sample sintering range wider. In addition, Cu also has excellent solderability and low cost. Copper powder has many advantages, but copper is easily oxidized in the air, especially in a high-temperature oxygen environment, where oxidation is particularly obvious and resistance rises sharply, affecting its application. Ni metal and Cu metal have similar properties, with good conductivity, chemical stability and solderability, but also poor high-temperature oxidation resistance, and need to be sintered in an inert atmosphere. In order to reduce costs, companies are constantly seeking base metals with good performance as substitutes, and base metal slurries have become the development direction of electronic slurries.

The global Base Metal Conductor Paste market size was estimated at USD 679.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
