Abstracts

A traditional data center server will be equipped with a BMC management chip embedded in the server motherboard. However, with the rise of the CPU+GPU+DPU concept in recent years, the model of using CPU for general computing, GPU for accelerated computing, and DPU for data processing has been defined as the trend of future cloud computing architecture. Since high-value components such as GPU and DPU bear very important workloads on the platform, the embedding of BMC management chips has also expanded from the motherboard level to the component level. A single server platform can even consume multiple BMC management chips, which has also led to an increasing demand for BMC management chips in the global server market.
