## Abstracts

Basic aluminium chloride, also known as aluminium chlorohydrate or polyaluminium chloride (PAC), is an inorganic coagulant and flocculant primarily used in water and wastewater treatment processes due to its effectiveness in removing suspended solids, colloidal particles, and organic matter; it functions by neutralizing the negative charges on particles, facilitating aggregation and sedimentation. The compound is also utilized in various industrial applications, including paper manufacturing as a retention and drainage aid, in the textile industry for dyeing and printing processes, and in the production of antiperspirants and deodorants where it acts as an active ingredient by forming temporary plugs in sweat ducts. Its advantages over traditional coagulants like aluminium sulfate include higher efficiency, lower dosage requirements, broader pH tolerance, reduced sludge production, and lesser residual aluminium content in treated water, making it a preferred choice in municipal and industrial water treatment systems.

The global Basic Aluminium Chloride market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
