Abstracts

Bathymetric Lidar (Light Detection and Ranging) sensors are advanced remote sensing instruments that utilize laser pulses to measure water depth and characterize underwater topography by calculating the time delay between the emission of a laser signal and the detection of its return after reflection from the water surface and seafloor; these systems typically employ green-light lasers capable of penetrating water columns, combined with near-infrared lasers to accurately capture the water surface, and are often deployed on airborne platforms such as aircraft, drones, or satellites to generate high-resolution bathymetric maps of coastal zones, shallow waters, and inland water bodies.

The global Bathymetric Lidar Sensor market size was estimated at USD 125.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.25% during the forecast period.
