Report Overview

Battery conductive materials are substances that have high electrical conductivity and are used to facilitate the flow of electric current within a battery. These materials are typically used in the electrodes and current collectors of batteries to enhance their performance and efficiency.

In rechargeable batteries, such as lithium-ion batteries, the positive electrode (cathode) and negative electrode (anode) are made of different conductive materials. The cathode material is usually a metal oxide, such as lithium cobalt oxide (LiCoO₂) or lithium iron phosphate (LiFePO₄), which can store and release lithium ions during the charging and discharging process. The anode material is commonly made of graphite or other carbon-based materials that can intercalate lithium ions.

The current collectors in batteries are typically made of conductive materials like copper or aluminum. These collectors help in the efficient transfer of electrons between the electrodes and the external circuit.
