Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Battery Fluid Defoamer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Battery fluid defoamers are highly effective additives specifically formulated for use in electrolytes of electrochemical systems such as lithium batteries. They are designed to inhibit or eliminate bubbles generated by gas evolution or liquid flow during filling, circulation, and charge/discharge processes. Their primary ingredients are silicone or polyether compounds with excellent compatibility and chemical stability. Without affecting battery performance, these defoamers can rapidly reduce electrolyte surface tension, disrupt foam stability, and prevent bubble accumulation from leading to poor interfacial contact, increased internal resistance, increased risk of thermal runaway, and reduced cycle life. They are key auxiliary materials for ensuring battery safety, consistency, and long-term stable operation. In 2024, the global production of battery fluid defoaming agent will reach 93,340 tons, with an average selling price of US\$1,946 per ton.

The global Battery Fluid Defoamer market size was estimated at USD 180.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
