Abstracts

Silicon-based negative electrodes or silicon-carbon negative electrodes, as the highest known lithium-embedded negative electrode materials, have become a new trend in the development of current lithium battery negative electrode materials. The use of nano-silica powder (particle size less than 150nm) to prepare lithium battery negative electrodes can not only effectively solve the volume expansion problem of silicon during the process of inserting and removing lithium, but also increases the affinity with the electrolyte, making the end product lithium battery with high capacity (can Reaching 4000mA/h) and having a large number of charge and discharge cycles. In the future, as new energy vehicles continue to upgrade their requirements for lithium batteries, the demand for nanosilica powder is expected to continue to grow. Global key players of nano silicon powder include Ames Goldsmith, DOWA Electronics Materials, Mitsui Kinzoku, TANAKA Precious Metals, etc. Global top five manufacturers hold a share over 77%. North America is the largest producer of nano silicon powder holds a share over 41%. In terms of product, 250-500nm is the largest segment, with a share over 46%. And in terms of application, the largest application is electronic materials, with a share over 79%.

The global Battery Grade Nano Silicon market size was estimated at USD 54.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 30.60% during the forecast period.
