## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Battery Powered Surgical Drill competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Battery-Powered Surgical Drill is a medical device used in various surgical procedures, primarily for drilling through bone or tissue. Unlike traditional drills that require a power cord or pneumatic system, battery-powered surgical drills rely on rechargeable batteries to provide mobility and flexibility during surgeries. These drills are designed to deliver high-speed rotation and precision while minimizing the risk of complications such as thermal injury. They are commonly used in orthopedics, neurosurgery, and dental surgeries, where precise bone or tissue removal is required. The battery-powered design allows for easy maneuverability in operating rooms and remote surgical settings, offering the benefit of portability, reduced risk of infection due to the absence of cords, and the ability to operate for extended periods on a single charge. Advanced models may come with multiple attachments, adjustable speeds, and ergonomic features to improve control and comfort for surgeons.

The global Battery Powered Surgical Drill market size was estimated at USD 901.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
