Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Battery Secondary Protection IC competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A battery secondary protection IC (Integrated Circuit) is an advanced safety component used in conjunction with a primary protection circuit to provide an additional layer of protection for lithium-ion or other rechargeable batteries. While the primary protection circuit typically safeguards the battery against overvoltage, undervoltage, and overcurrent, the secondary protection IC adds extra protection mechanisms to further enhance the safety and longevity of the battery. This IC helps monitor and control additional factors such as temperature, charging and discharging cycles, and the detection of abnormal conditions like short circuits or cell imbalances. By actively managing these parameters, the secondary protection IC helps prevent potential risks like thermal runaway, battery degradation, and fire hazards. Commonly used in applications that demand high reliability and extended battery life, such as electric vehicles, power tools, and portable electronic devices, the secondary protection IC ensures that the battery remains within safe operating limits throughout its lifecycle.

The global Battery Secondary Protection IC market size was estimated at USD 853.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
