Abstracts

BCG Vaccine is a vaccine primarily used against tuberculosis. Tuberculosis is a serious infection, which affects the lungs and sometimes other parts of the body, such as the bones, joints and kidneys. The bacille Calmette-Gu?rin (BCG) vaccine has existed for 80 years and is one of the most widely used of all current vaccines, reading >80% of neonates and infants in countries where it is part of the national childhood immunization programme.The tuberculosis (TB) vaccination market is driven by the global efforts to combat TB and the increasing burden of the disease in high-risk populations. TB is a highly contagious bacterial infection that poses a significant public health challenge worldwide. Vaccination against TB, primarily through the Bacille Calmette-Gu?rin (BCG) vaccine, is essential in reducing TB incidence and severity, especially in endemic regions. The rise in TB cases and drug-resistant strains contribute to market growth as governments and healthcare organizations focus on prevention strategies. Moreover, advancements in vaccine research and development, including novel TB vaccines under investigation, have the potential to further improve TB control efforts. However, the market also faces challenges, including the variable efficacy of the BCG vaccine against different forms of TB and the need for improved vaccine coverage in high-burden areas. Additionally, addressing vaccine supply and distribution challenges and ensuring equitable access to TB vaccination can pose obstacles for comprehensive disease control. To succeed, companies must focus on research and development to offer innovative TB vaccine candidates, collaborate with global health initiatives to promote vaccination campaigns, and address the challenges to meet the increasing demand for effective TB prevention solutions.

The global BCG Vaccination market size was estimated at USD 80.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.00% during the forecast period.
