Report Overview

Brain-Computer Interface (BCI) and Electroencephalography (EEG) technologies are rapidly evolving fields that enable direct communication between the human brain and external devices. BCIs translate neural signals into actionable commands, while EEG measures electrical activity in the brain through non-invasive scalp electrodes. These technologies have applications in healthcare (assistive devices for paralysis, epilepsy monitoring), gaming, neurofeedback, and even military and aerospace sectors. The market is driven by advancements in AI, machine learning, and neural signal processing, alongside growing demand for non-invasive neurological diagnostics and rehabilitation tools. Key players include medical device manufacturers, neurotech startups, and research institutions, with increasing investments from tech giants exploring consumer applications. However, challenges such as signal accuracy, data privacy, and regulatory hurdles remain barriers to mass adoption. The market is projected to grow significantly, fueled by increasing neurological disorder prevalence and expanding use cases in augmented reality and brain-controlled prosthetics.

The global BCI and EEG market size was estimated at USD 939.37 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.00% during the forecast period.
