Report Overview

The incident light whose light intensity distribution is not uniform enough to meet specific application requirements is transformed into optical components with improved light intensity distribution uniformity and capable of meeting application requirements through beam shaping. The optical field homogenizer is an important core component of many high-end optical equipment such as lithography machines. It can evenly illuminate the processed integrated circuit wafer with the beam of excimer laser in the lithography machine. Uniformity: The uniformity indicates the homogenization effect of the light field homogenizer. The smaller the unevenness value, the higher the requirements for technology and process, and the better the homogenization effect of the light spot.
