## Abstracts

The slapping homogenizer is a device that homogenizes and mixes solid or semi-solid samples by slapping or impacting. It can homogenize and mix samples in a sealed state, thereby eliminating cross-contamination between samples. The working principle of the slapping homogenizer is to slap or impact the sample through the internal slapper, so that the sample is subjected to uniform shear force and impact force in the homogenization bag, thereby achieving homogenization and mixing of the sample. The equipment adopts a stainless steel system, and the sample is placed in a disposable sterile homogenization bag, which does not come into direct contact with the instrument, thereby avoiding contamination and damage to the sample.

The global Beating Homogenizer market size was estimated at USD 764.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
