Abstracts

The beating and freeness tester is a specialized laboratory instrument utilized within the pulp and paper industry to measure the degree of fibrillation and hydration of pulp fibers through mechanical beating, as well as to determine the freeness or drainage rate of the resulting pulp slurry. This device operates by subjecting a pulp sample to controlled mechanical action in a standardized chamber, after which the drainage time or volume of water released is measured to calculate the Canadian Standard Freeness (CSF) or Schopper-Riegler values, which are critical indicators of pulp quality and its suitability for specific paper grades. The results provided by the tester influence decisions in pulp processing, refining optimization, and final product characteristics, making it an essential tool for quality control and research and development in paper manufacturing.

The global Beating And Freeness Tester market size was estimated at USD 32.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
