Report Overview

Below-the-knee stenosis is generally caused by atherosclerosis or build-up of plaque below the knees. Plaque build up refers to the fatty acids deposit below the knee. Calcification in the arteries, is also an important cause of below-the-knee stenosis.

There are two main types of treatments for below-the-knee stenosis i.e. balloon angioplasty and atherectomy. In this procedure, a balloon tipped catheter is used. A thin guide wire is also used which play a major role in pushing the plaque towards the wall of the artery. Atherectomy is a treatment procedure which involves a catheter, being introduced within the blood vessel. The catheter can be used alone or it can be used along with the balloon tipped catheter.
