Report Overview

Benserazide Hydrochloride is a pharmaceutical compound that serves as a decarboxylase inhibitor, primarily used in the treatment of Parkinson's disease. It works by preventing the conversion of levodopa to dopamine outside the brain, thereby increasing the availability of levodopa to the brain and enhancing its therapeutic effects. This medication is often prescribed in combination with levodopa to manage the symptoms of Parkinson's disease, such as tremors, muscle stiffness, and movement difficulties. Benserazide Hydrochloride helps to reduce the peripheral side effects of levodopa and allows for a lower dosage, which can decrease the risk of side effects like nausea and vomiting.
