Abstracts

Bent axial piston pumps are a specific type of hydraulic pump in which a rotating group of pistons is arranged axially within a cylinder block but mounted at an angle (or "bent") relative to the drive shaft. This angular displacement?often adjustable in variable displacement models?allows the pistons to reciprocate within their bores as the block rotates, drawing in fluid during the suction stroke and pressurizing it during the discharge stroke. The key design feature is the swashplate or bent-axis mechanism, which converts the rotary motion of the shaft into the axial reciprocating motion of the pistons, enabling precise control over flow rate and pressure. These pumps are valued for their high efficiency, compact design, ability to handle high pressures, and suitability for applications requiring variable flow without significant losses, making them critical components in mobile machinery, industrial systems, and aerospace hydraulics.

The global Bent Axial Piston Pump market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
