Abstracts

The name bentonite was first suggested in 1898 for clay hosted by the Benton Shale in Wyoming. It was initially described as clay formed by the alteration of volcanic ash, but the most widely used commercial definition is that bentonite is clay consisting essentially of smectite minerals (usually montmorillonite) regardless of occurrence or origin. Most economic bentonite deposits are of Cretaceous age or younger and associated with marine shale and marl (Wyoming), calcareous sands and marls (Morocco), carbonaceous shales and coal (South Africa), sandstone and conglomerate (Australia), dacitic pyroclastics and tuffs (Milos), andesite (China) or rhyolite and obsidian/perlite (China and Mozambique). Bentonite is characterised by exchangeable cations such as Ca^{2+} , Mg^{2+} , Na^{+} or Li^{+} which affect its designation and properties. For example, bentonite is typically described as either swelling or nonswelling bentonite. Swelling bentonite (also known as western bentonite) is sodium bentonite that swells in water and is generally used in its natural state. Non-swelling bentonite is calcium bentonite (also known as southern bentonite) that is used as mined, after treatment with soda ash to produce sodium-exchanged bentonite, or treated with acid to produce bleaching clay. Li-rich bentonite is known as hectorite and is commercially mined only in the US. Natural bentonites occur in two main forms: Na-based and Ca-based. While Ca-bentonite is more common, Na-bentonite is a more effective binder. To boost the binding power of Ca-bentonite, it is subjected to a chemical reaction with soda ash to activate its outer and inner surfaces, which increases its ability to bind water. Global Bentonites main players include Amcol (Minerals Technologies), Bentonite Performance Minerals, Wyo-Ben Inc, Black Hills Bentonite, Tolsa Group, Imerys (S&B), etc., totally accounting for about 37%. North America is the largest market, with a share over 35%. As for the types of products, it can be divided into Sodium Bentonite and Calcium Bentonite. The most common product is Calcium Bentonite, with a share over 92%. In terms of applications, it is widely used in Molding Sands, Iron Ore Pelletizing, Pet Litter,

Drilling Mud, Civil Engineering, Agriculture and Others. The most application is in Iron Ore Pelletizing, with a share over 27%.

The global Bentonites market size was estimated at USD 1392.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
