Abstracts

Anticholinergic drugs for Parkinson's disease (PD) are medications that block the action of acetylcholine in the brain to help balance the neurotransmitter activity disrupted by dopamine deficiency. These drugs are primarily used to control tremors and muscle stiffness in Parkinson's patients, particularly in the early stages of the disease. By inhibiting excessive cholinergic activity, anticholinergic agents can provide symptomatic relief and improve motor function. Common anticholinergic drugs for PD include benztropine and trihexyphenidyl. Benzhexol Hydrochloride, also known as Trihexyphenidyl, is an anticholinergic drug primarily used to treat Parkinson's disease and drug-induced extrapyramidal symptoms. It works by blocking acetylcholine receptors in the central nervous system, helping to restore the balance between dopamine and acetylcholine, which is disrupted in Parkinson's disease. This mechanism helps reduce symptoms such as muscle stiffness, tremors, and involuntary movements, improving motor function in affected patients.

The global Benzhexol Hydrochloride Drug market size was estimated at USD 64.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
