Abstracts

Benzoxazine resins are prepared from the reaction of 1:1:2 (molar ratio) of amine, phenol and formaldehyde. When heated, they homopolymerize readily to form rigid polymers that can be widely used as high-temperature composites, high performance copper clad laminates and plastic packaging materials. Improved properties can be obtained by combining with epoxy or phenolic resins, catalysts or toughening agents. Electronic-grade resin has the characteristics of high insulation reliability, high heat resistance, low dielectric constant, low dielectric loss, low thermal expansion coefficient, etc., and is used in copper-clad laminate base materials, device packaging molding compounds, and circuit board inks on printed circuit boards. In other aspects, it can be widely used in 5G/6G communications, automotive electronics, consumer electronics and other fields. Electronic grade resins include electronic grade phenolic resins, special epoxy resins, benzoxazine, bismaleimide resin and other functional polymer materials. Benzoxazine resin has gradually attracted attention due to its higher heat resistance, better flame retardancy, lower water absorption, better dielectric properties, no release of small molecules during curing, and nearly zero shrinkage in volume. Favored by the copper clad laminate industry, benzoxazine resin is widely used in M2 and M4 grade copper clad laminates in Asia-Pacific. In North America, benzoxazine resin is more used in the aerospace field.

The global Benzoxazine Resin market size was estimated at USD 107.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
