Abstracts

In 2024, the average deployment cost of a single berth approach management system was approximately USD 110,000?160,000 per port (approximately USD 3,000?12,000 per month if using a SaaS subscription). Berth approach management system is primarily used in port dispatch centers to achieve functions such as visualization of vessel arrival schedules (ETAs/ETDs), berth resource allocation, tidal and meteorological linkage, tugboat pilotage scheduling, terminal operation load forecasting, and port congestion early warning. Key performance indicators include the number of supported berths, vessel schedule forecast accuracy (typically >85%), AIS/port TOS system interface compatibility, automatic rule-based scheduling capabilities, and mobile terminal access capabilities. The system's value lies in reducing average berthing delays caused by berthing conflicts, operational waiting, and missed tide windows (reducing delays by 8?18 hours per vessel), thereby significantly improving terminal throughput efficiency and shipping network on-time performance. The upstream mainly consists of AIS/weather/tidal data services, TOS/ERP system interface development, and cloud server computing power costs; downstream customers include public port operators, container terminal groups, oil and gas terminals, and bulk cargo ports. As a berth scheduling system vendor focusing on visualization and prediction algorithms, Portchain had approximately 65?75 port/terminal customers with operational deployments in 2024, primarily through subscription-based SaaS.

The global Berth Approach Management System market size was estimated at USD 84.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.20% during the forecast period.
