Abstracts

BGA chip rework station is a device specially used for repairing and replacing BGA (Ball Grid Array) packaged chips. It uses hot air flow to gather on the pins and pads of BGA chips to melt the solder joints or reflow the solder paste to complete the disassembly or welding functions. BGA chip rework station has the characteristics of high precision, high efficiency, multi-function and easy operation, and is widely used in communications, consumer electronics, automotive electronics and other fields. BGA chip rework station can be divided into optical alignment and non-optical alignment according to function. Optical alignment uses split prism imaging through optical module; non-optical alignment is to align BGA according to the silk screen line and point of PCB board by naked eyes to achieve alignment rework. Intelligent operation equipment for visual alignment, welding and disassembly of BGA components of different sizes effectively improves rework rate productivity and reduces costs.

The global BGA Chip Rework Station market size was estimated at USD 487.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
